Investor Day agenda

9:30 am Welcome

Overview of F&P Mexico operations

10:00 am Break

10:30 am Business Excellence Model

Purpose, People, Process, Performance

11:00 am Tour of manufacturing areas

12:00 pm Q&A

12:30 pm Lunch

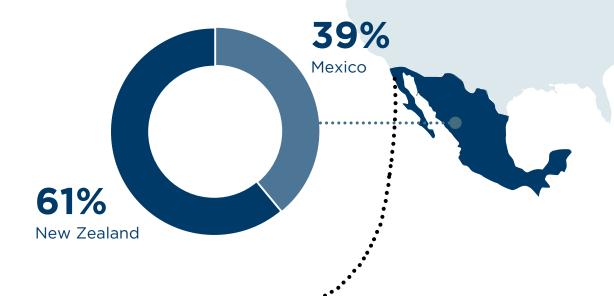

2:00 pm Depart for Irvine, California

F&P Mexico manufacturing

F&P Mexico overview:

- First breathing circuit shipped in 2010.
- Diversified manufacturing.
- 1,900+ collaborators.
- Hospital and Homecare consumables.
- Mexico contributes 39% of manufacturing.

Mexico facilities:

• Three buildings: 63,000 m² / 690,000 ft².

Medical device industry in Tijuana

Tijuana is a world leader in the manufacturing of medical devices.

- 90% of medical device companies are certified under ISO13485, FDA or CE mark.
- +80 medical device manufacturing plants in Tijuana.
- >74,000 people employed in Tijuana medical device manufacturing.

F&P benefits of manufacturing in Tijuana:

- Time zones overlap.
- Medical device manufacturing skills.
- Diversified product supply.
- Proximity to major markets.
- Relatively stable manufacturing labor costs.

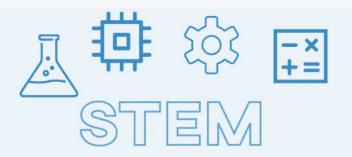

Medical device industry driving education

Supporting high-end manufacturing industries, such as medical devices, requires an innovative workforce and investment in education and research on both sides of the border.

Baja California offers 89 public & private universities

9 Universities with Cross-Border Partnerships

In 2021, engineering was the STEM field with the highest number of degrees conferred at 3,700, followed by health sciences at 2,500 degrees in Baja California.

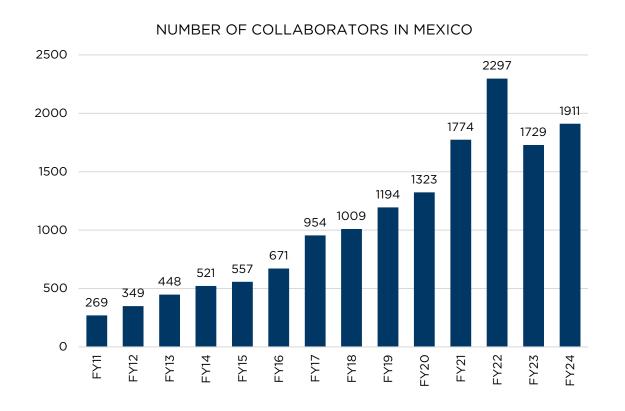

San Diego had nearly **34,000** workers dedicated to scientific research and development services, over **23,000** people in computer systems design and related services, and nearly **12,000** people at colleges and universities.

Global CI Award - Inspiratory Limb Assembly Cycle Time Reduction

Benefits

 Integration of multidisciplinary **VISION CIRCUITS** team to deliver results.

Integrate

- Competitive advantage to meet customer needs in the delivery of Vision Circuit kits.
- Increase adaptability, resilience and quick response to any global demand change.
- Creating value by developing personnel who are capable of working as a team in urgent situations.

- Better operational safety by providing more space and a more controlled work pace for our production people.
- Use of Lean tools to analyze and identify better options to reach goals.

In-house manufacturing heater wire project

Benefits

(E) **Supply Chain**

- · Competitive advantage in product supply chain, reducing shipping cost/time.
- Increase adaptability, resilience and quick response to any global demand change.

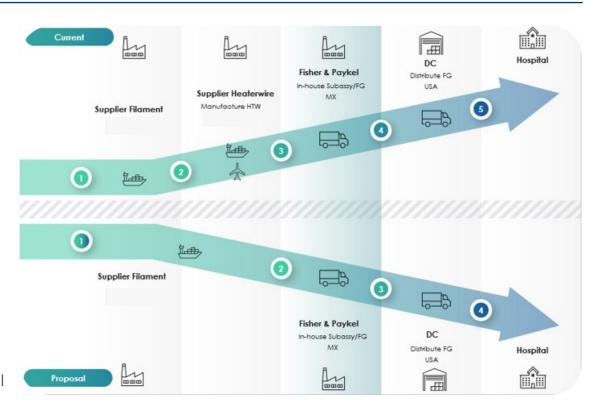

Integrate

People

 Internal Talent developing new processes and technology.

Process

- Increase Autonomy & Self-sufficiency in critical manufacturing process.
- Eliminate/reduce any risk associated with manufacturing process.

F&P Evora Full Compact Full Face Mask

Benefits

EVORA FULL Introduction into MX

- Developing Internal Talent to manufacture Evora Full.
- Integration of multidisciplinary team to deliver results.

Integrate Supply Chain

- Competitive advantage in releasing a second manufacturing source for the Evora Full Face Mask in Mexico.
- Increase adaptability, resilience and quick response to any global demand change.
- Creating value developing local suppliers to reduce our lead times.

Process

- Increase capacity introducing 43 new SKUs into MX site.
- Competitive advantage with the introduction of an innovative product with a face mask that seals underneath the nose, rather than over the nose.

CONFERENCE REPORTS AND EXPERT PANEL

ESICM guidelines on acute respiratory distress syndrome: definition, phenotyping and respiratory support strategies

Recommendation 3.1

We **recommend** that non-mechanically ventilated patients with AHRF not due to cardiogenic pulmonary edema or acute exacerbation of COPD receive HFNO as compared to conventional oxygen therapy to reduce the risk of intubation Strong recommendation; moderate level of evidence in favor

We are **unable to make a recommendation** for or against the use of HFNO over conventional oxygen therapy to reduce mortality *No recommendation; high level of evidence of no effect*

This recommendation applies also to AHRF from COVID-19 Strong recommendation; low level of evidence in favor for intubation and no recommendation; moderate level of evidence of no effect for mortality, for indirectness.

Updated systematic review

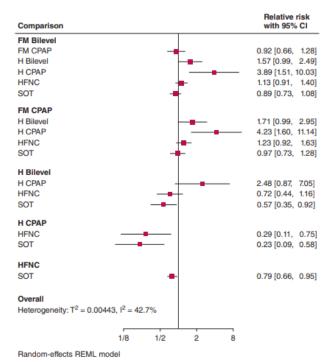

Figure 5 - Network forest plot for mortality. The comparisons are boldfaced, and the interventions are listed below each comparison. This forest plot includes the network estimates for all comparisons for mortality. FM = face mask; H = helmet; HFNC = high-flow nasal cannula; REML = restricted maximum likelihood; SOT = standard oxygen therapy.

Less heterogeneity by excluding: ED, post op, AECOPD, pulmonary edema

What we do

Began with a protocol

Proactive Use of High-Flow Nasal Cannula With Critically Ill Subjects

Keith D Lamb RRT RRT-ACCS, Sarah K Spilman MA, Trevor W Oetting RRT, Julie A Jackson RRT RRT-ACCS, Matthew W Trump DO, and Sheryl M Sahr MD MSc

INTRODUCTION: It has been suggested that use of a high-flow nasal cannula (HFNC) could be a first-line therapy for patients with acute hypoxic respiratory failure. The purpose of this study was to determine if protocolized use of HFNC decreases unplanned intubation and adverse outcomes in an ICU population. METHODS: The study was a prospective evaluation of 2 cohorts who received HFNC per protocol. Control groups were retrospective selections of subjects who received HFNC in the pre-protocol period. Cohort 1 (n = 88) received mechanical ventilation for ≥ 24 h and was extubated directly to HFNC following strict protocol criteria. Cohort 2 (n = 83) were placed on HFNC when oxygen requirements escalated (>4 L/min). RESULTS: Cohort 1 did not differ from its control group in mortality, hospital stay, or ICU days, but there were significant decreases in incidence of Gram-negative pulmonary infection (30% vs 9%, P = .001) and use of bronchodilator therapy (81% vs 61%, P = .008). Failed extubation rates were nearly identical across groups, but time to re-intubation was shorter in the protocol group (24 vs 13 h, P = .19). Cohort 2 did not differ significantly from its control group in intubation rates or mortality, but subjects managed by protocol experienced significant decreases in ICU days (4 vs 3 d, P = .03) and hospital days (12 vs 8 d, P = .007). There was a trend toward fewer hours on HFNC (33 vs 24 h, P = .10) and faster time to intubation when HFNC failed (19 vs 9 h, P = .08). CONCLUSIONS: Extubation to HFNC led to a significant decrease in pulmonary infections and bronchodilator therapy in Cohort 1 but did not reduce length of stay or rates of failed extubation. When HFNC was used early and per protocol (Cohort 2), ICU and hospital lengths of stay were reduced and HFNC was initiated more quickly when the need for respiratory support escalated. Key words: highflow nasal cannula; respiratory failure; mechanical ventilation; postextubation management; reintubation; pulmonary infection. Lamb et al.

- Summary:
 - No increased adverse outcomes
 - Earlier recognition of respiratory failure and faster escalation of therapy
 - Efficacious protocol generalizable to broad, critically ill populations
 - Shorter hospital and ICU lengths of stay for patients with increasing need for respiratory support
 - Respiratory infection rates were lower when NHF is primarily used in postextubated patients
 - NHF managed care per protocol may reduce unnecessary medication use

Why go beyond ICU?

- ICU and ED beds are a scarce and costly resource
- Review of internal data (MET team) demonstrated potential benefit in respiratory distress +/- acute hypoxic respiratory failure
 - Not requiring invasive mechanical ventilation
- Patients who meet strict criteria could be effectively and safely managed on therapy on outside the ICU

UPH DM Inclusion Criteria for Outside ICU

Traditional nasal cannula does not meet patient flow demand and/or FiO2 requirement.

COPD, asthma, respiratory infections causing AHRF, and other cardiopulmonary conditions

Rib fractures or pulmonary contusions

 Splint open of the airways during healing process Dyspnea and/or increased work of breathing

Hypoxemia requiring >4 lpm oxygen

P/F ratio >150

ED: Above criteria used

 Intolerance to noninvasive mechanical ventilation or CPAP via EMS at 7 cm H20 or less

UPH DM Inclusion Criteria for Outside ICU

Hydration of thickened secretions

Tracheostomy patients:

- Requiring higher flows
- Heat and humidity benefit
- Evidence for faster decannulation

Palliation for air hunger, dyspnea, and/or hypoxia at the end of life

UPH DM Exclusion Criteria for outside ICU

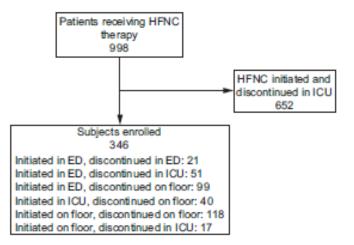

- Obtunded and unable to maintain airway
- Severe respiratory acidosis (ventilatory failure)
- Suspected facial fractures or skull fractures
- Shock
- Upper airway obstruction

Use Outside the ICU is Safe and Effective

Implementation of High-Flow Nasal Cannula Therapy Outside the Intensive Care Setting

Julie A Jackson, Sarah K Spilman, Lisa K Kingery, Trevor W Oetting, Matthew J Taylor, William M Pruett, Christopher R Omerza, Kaitlin A Branick, Iaswarya Ganapathiraju, Mikayla Y Hamilton, Dakota A Nerland, Philip S Taber, Dustin A McCann, Carlos A Pelaez, and Matthew W Trump

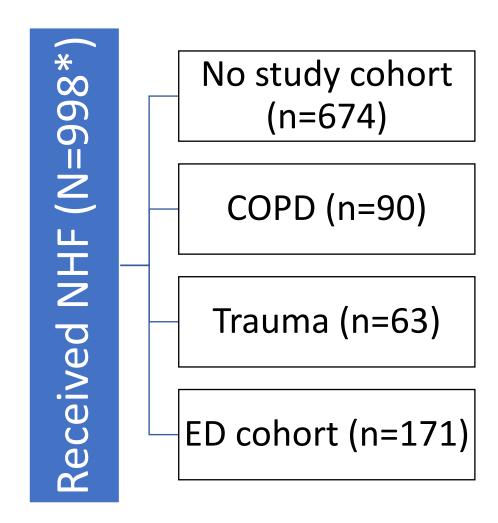

RESPIRATORY CARE • MARCH 2021 Vol. 66 No 3

Use Outside the ICU is Safe and Effective

- 66% avoided ICU
- 486 hospital days outside ICU
- 44h duration
- Escalation of care
 - 5% intubated
 - 6% NIV
 - 13h to escalation
- Low mortality 13%

Our Experience

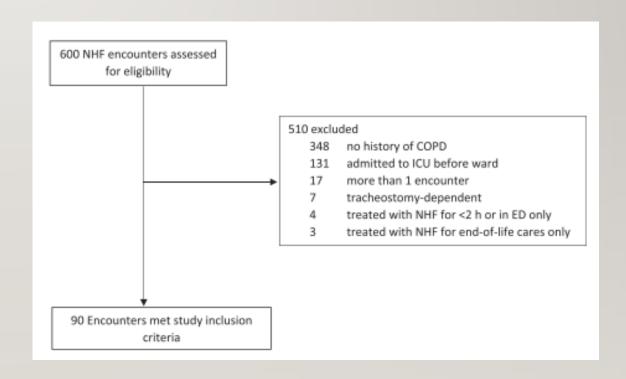

COPD COHORT

Study Inclusion Criteria:

- Hypoxemia requiring > 4 LPM Oxygen
- Admitted directly to floor from ED or direct admission
- History of COPD
- Must have consult from Pulmonology team

Study Exclusion Criteria:

- Trach dependent
- Palliation only
- NHF < I hour
- ICU before floor

Clin Respir J. 2021; 1–7.

TRAUMA COHORT

Study Inclusion Criteria:

- Hypoxemia requiring > 4 LPM Oxygen
- Therapy initiated in ED, ICU, or floor
- Significant chest wall trauma (3 ≥ rib fractures)
- Part of multi-modal pain management regimen

Study Exclusion Criteria:

- NHF < I hour
- Received mechanical ventilation prior to NHF
- Old or age-indeterminate rib fractures
- Tracheostomy

ORIGINAL RESEARCH

High-Flow Nasal Cannula for Chronic Obstructive Pulmonary Disease with Acute Compensated Hypercapnic Respiratory Failure: A Randomized, Controlled Trial

> This article was published in the following Dove Press journal: International Journal of Chronic Obstructive Pulmonary Disease

- Ward patients
- pH > 7.35, PaO₂ < 60 mmHg, PaCO 45 mm Hg

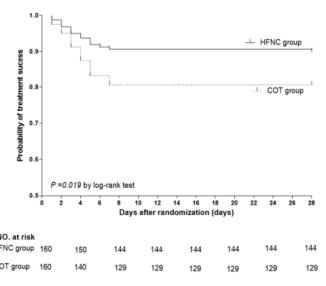

Figure 2 Kaplan-Meier estimates of the probability of treatment success at 28 d between the high-flow nasal cannula oxygen therapy (HFNC) group and the conventional oxygen therapy (COT) group. Significant differences were found for the cumulative probability of treatment success for the two groups (Log rank test: p = 0.019).

Table 2 Primary Endpoint and Secondary Endpoints in the Two Groups

| Outcome | All Patients (n=320) | HFNC Group (n=160) | COT Group (n=160) | P |
|---|----------------------|--------------------|-------------------|--------|
| Primary end point | | | | |
| Treatment failure, need of NIV, no. (%) | 47(14.7) | 16(10.0) | 31(19.4) | 0.026 |
| Secondary end point | | | | |
| Patients received NIV, no. (%) | 39(12.2) | 13(8.1) | 26(16.3) | 0.039 |
| CAT scores at discharge | 15.2±7.8 | 12.0±7.6 | 17.0±7.3 | 0.002 |
| Subjective discomfort score | 3.3±1.6 | 2.3±1.1 | 3.9±1.6 | <0.001 |
| Hospital lengths of stay (days) | 12.7±4.8 | 12.2±5.3 | 12.9±4.5 | 0.453 |
| Readmission rate within 3 months, no. (%) | 77 (24.1) | 32 (20.0) | 45 (28.1) | 0.116 |
| Reason for NIV | | | | |
| Respiratory acidosis | 36(11.3) | 12(7.5) | 24(15.0) | 0.050 |
| Obvious dyspnea | 11(3.4) | 4(2.5) | 7(4.4) | 0.542 |

Notes: Data are presented as mean ± standard deviation or No. (%). Treatment failure was defined as worsening of the patients' condition to the point that noninvasive or invasive mechanical ventilation was required.

Abbreviations: CAT score, COPD assessment test score; COT, conventional oxygen therapy; HFNC, high-flow nasal cannula oxygen therapy; NIV, noninvasive mechanical ventilation.

Conclusions

- Nasal high flow is a well established, effective mode of support for patients with acute hypoxic respiratory failure
- Nasal high flow is an effective therapy for hospitalized patients with COPD and other respiratory conditions
- Patients supported with nasal high flow can be safely managed outside the ICU reducing costs and sparing vital resources

Robert Y. Goldberg, MD
Pulmonary & Critical Care Specialist, Providence Mission Hospital
Using Nasal High Flow in the Critical Care environment

Julie Jackson, RRT Fisher & Paykel Healthcare, Clinical Affairs Specialist

Introduction

- Can you please describe the Critical Care services at Providence Mission Hospital along with your role and typical patients the hospital serves?
- Can you describe your journey of adoption of high flow? What patients now routinely start on high flow? How has this changed your use of COT and NIV?
- How have these changes affected your patient outcomes and performance metrics?

Impact of the pandemic

- Can you describe the impact of high flow for you during COVID-19?
- What were the challenges of using high flow during COVID-19 and how were these addressed?
- How were other respiratory support strategies affected during COVID-19?
- How has COVID-19 changed the way you treat respiratory compromised patients?

Today and beyond

- How do you see high flow therapy expanding across your hospital?
- Where do you see research and education gaps with high flow?

James B. Price, MD
Emergency Medicine Specialist, Providence Mission Hospital
Using Nasal High Flow in the Emergency Department

Julie Jackson, RRT Fisher & Paykel Healthcare, Clinical Affairs Specialist

Introduction

- Can you please describe the Emergency Department services at Providence Mission Hospital along with your role? What are your ED goals? How is your performance measured?
- What ED patient types typically receive high flow?
- How does an ED physician decide when to implement high flow? What is your primary goal for these patients?

Impact of the pandemic

- How were you using high flow in your ED prior to COVID-19?
- During the COVID-19 pandemic, what were your challenges with using high flow in your ED? Physician/RT acceptance etc?
- How has your clinical practice with high flow changed post-COVID-19?

Today and beyond

- Do all ED physicians follow the same or similar treatment approach when using high flow (ie. flowrate & FiO₂) – has the therapy become protocolized or is it still variable?
- Similar to the question to Dr Goldberg but now in the ED, where do you see research and education gaps with high flow in the ED?

Focus Topics

- Providence / St Jude Medical Center HF Experience
- How we adopted High Flow
- Future utilization opportunities

Providence St Jude Medical Center

FACTS:

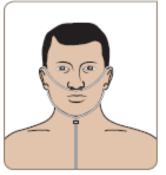

- Established 1957
- 320-bed, acute care hospital
- Approx 2400+ caregivers
- Approx 700+ physicians
- 70,000+ ED visits
- Approx 450,000 OP visits

Understood Clinical Need

LOW FLOW **NASAL PRONGS**

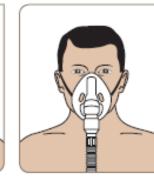

SIMPLE **FACE MASK**

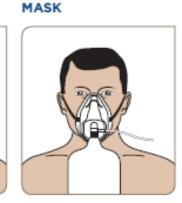

FLOW MASK

HUMIDIFIED HIGH

VENTURI STYLE MASK

REBREATHER

Reviewed Available Clinical Research

| Roca - HF Oxygen Therapy Respiratory Care, April 2010 | HFNC was better tolerated and more comfortable than face mask; was associated with better oxygenation and lower respiratory rate; could have an important role in treatment of patients with acute respiratory failure. |
|---|---|
| Parke - RCT Respiratory Care, March 2011 | NHF is more successful than the <i>gold standard</i> High Flow Face Mask in the management of mild to moderate hypoxemic respiratory failure. |
| Corley - NHF EIT British Journal Anesthesia, June 2011 | HFNC reduces respiratory rate and improve oxygenation by increasing both EELV and tidal volume and are most beneficial in patients with higher BMI's. |
| Sztrymf - Pilot HFNC Intensive Care Medicine, September 2011 | HFNC has a beneficial effect on clinical signs and oxygenation in ICU patients with acute respiratory failure. |

Conducted Evaluations & Implemented in ICU - Defined the Target Patient Population

- Patients using oxygen masks
- Patients using Oximizer
- Borderline post extubation patients
- Mild-Mod respiratory distress
- Combo NIV/HF therapy

Conducted Evaluations & Implemented in ICU – Prepared equipment

- MR850 Humidifier
- Temp Probe & Pigtail
- RT202 Circuit
- F&P Cannula
- IV Pole w/ Basket
- High Flow Blender
- 70 L/min Flowmeter & Gas Hoses

LOW FLOW

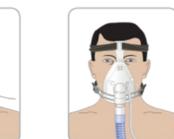

NASAL PRONGS

Hospital wide adoption prior to, during and after COVID-19

CONVENTIONAL OXYGEN THERAPY

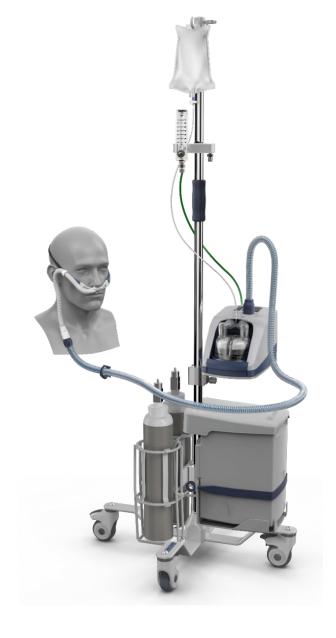

NONINVASIVE

VENTILATION

Future Utilization

- Increased high flow use outside Critical Care / Emergency Dept.
- Increased use on higher acuity patients as additional research is available
- Increased flow rate for added patient benefit and improved outcomes
- Increased transport/procedure use; Emergency dept, Post-Op
- Increased use for humidity therapy purposes

8,000+

customers in Hospital and Homecare

Proven successful team

in changing clinical practice and driving Sustainable, Profitable Growth

North America - our people and our culture

Total People: 411

- We value diversity of thought and people. We strive to create a positive and inclusive environment where everyone can contribute the most they can over the long term
- Sales teams focused on changing clinical practice. Working closely with clinicians across the healthcare continuum as Trusted Advisors
- Sales teams are a balance of sales and medical professionals with average tenure of 5+ years
- Strong operations team supporting sales growth with a continuous improvement culture

Our technology

US Hospital business model

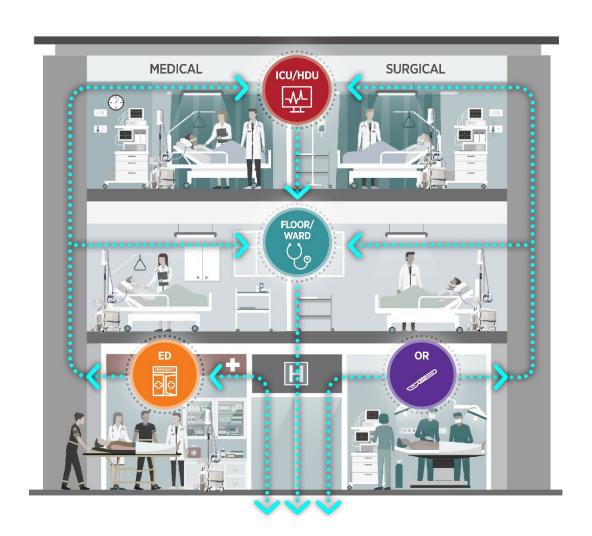

Opportunity across all areas of the hospital

Our product range allows us to treat respiratory patients across all areas of the hospital

- Medical Intensive Care Units
- Surgical Intensive Care Units
- Emergency Departments (ER)
- Floor/Ward
- Operating Room

Our sales teams become experts in the clinical application of our products focused on changing clinical practice

The sustainable sales process

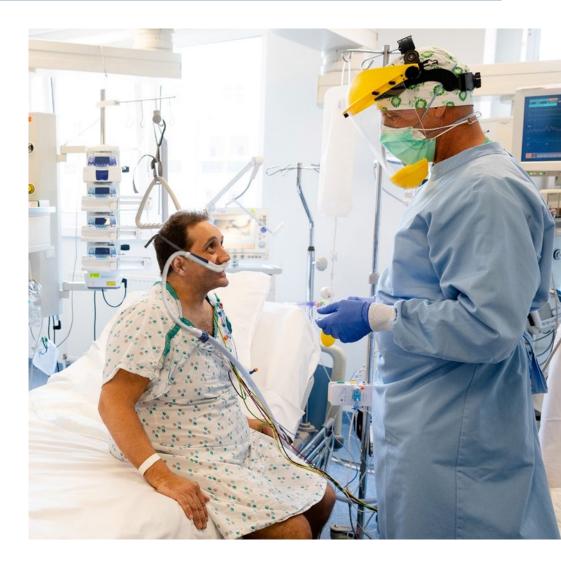

Post-COVID hospital environment

Rapid exposure to a new tool - Many steps in the educational process of utilizing a new clinical tool were skipped during the COVID pandemic.

Access to clinicians - Our teams are re-engaging with clinicians to build on the knowledge and understanding for a more comprehensive usage of High Flow Therapy.

Clinical practice guidelines - Clinical practice guidelines have now been published. These guidelines assist our sales teams in changing clinical practice.

Steady progress - We see ongoing signs of increasing utilization and our sales teams are focused on the journey of changing clinical practice within the Hospital.

Case studies

Case study - Margaret Murphy

Case study - Mark Miller

Health system standardization - case study

Presented by Megan Hadley - East Regional Manager

- A 40 hospital system, 8,000 beds
- F&P Active Humidification has been the Gold Standard
- Nasal High Flow journey began in 2017
- 2018 & 2019 began expanding and investing in the therapy systemwide
- Post pandemic understand the need to standardize Nasal High Flow Policies systemwide
- What's ahead:
 - Working to implement Nasal High Flow Policies (ED, ICU & Floor) systemwide
 - Standardizing NIV platform to Fisher & Paykel

The sustainable sales process

- Market leading position in Humidification Technologies
- Strong partnerships with GPOs and distribution networks that capture our entire portfolio
- Utilizing clinical evidence to build confidence and demonstrate value
- Working closely with clinicians to support and provide solutions across the care continuum
- Steady progression of acceptance and usage across our customer base

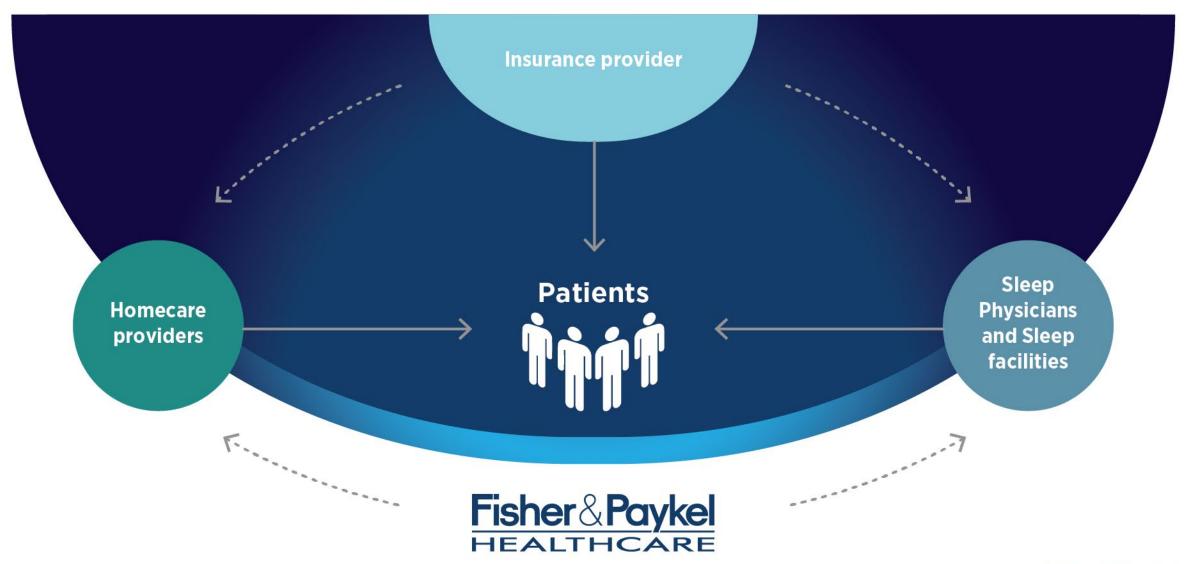

Steve Polgar
VP Sales & Marketing Homecare

US Homecare business model

Over 20 years of mask innovation

Comprehensive approach to Physician, Patient & Provider

myMask[™] App Initial setup and support

Support patient mask setup. Fit, fine-tune and clean.

VentiCool

Comfort

Breathable headgear designed to allow for heat and moisture to escape.

CapFit
Ease of use

Just like putting on a cap. Intuitive.

Dynamic Support Technology Performance

Freedom of movement while keeping the mask in place.

Our focus in OSA

Building on 20 years of innovation to develop market leading OSA Mask technologies that focus on:

- Improving Homecare Provider efficiencies
- Referral source satisfaction
- Patient satisfaction
