F&P Optiflow Nasal High Flow

Fisher & Paykel HEALTHCARE

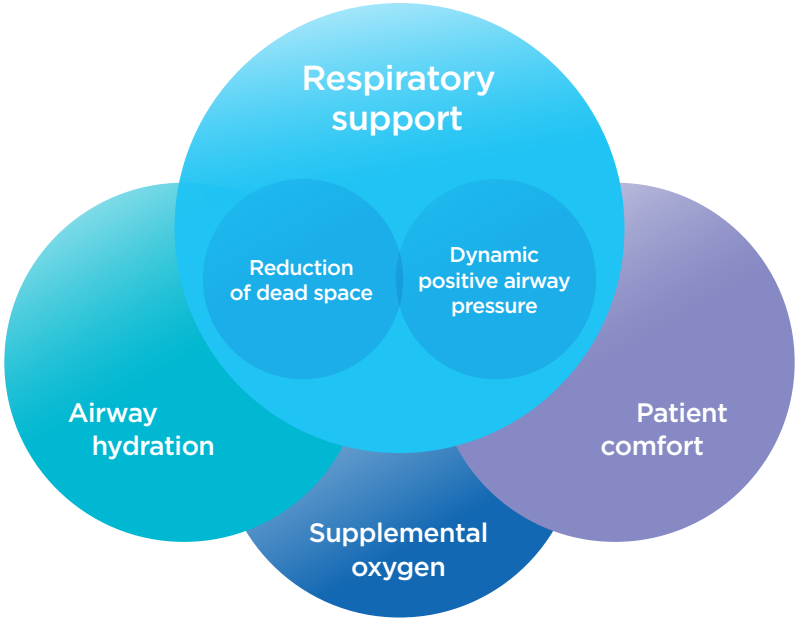
Understand **Optiflow™** Nasal High Flow

Optiflow Nasal High Flow (NHF) delivers respiratory support to your spontaneously breathing patients, by providing heated, humidified air and oxygen at flow rates up to 60 L/min through the unique Optiflow nasal cannula.

Read on to discover more about:

- mechanisms
- physiological effects
- clinical outcomes and how using Optiflow NHF can reduce escalation, thereby avoiding its associated costs.

MECHANISMS OF ACTION



With Optiflow NHF, you can independently titrate flow and oxygen concentration (FiO_2 21 - 100%) according to your patient's needs.

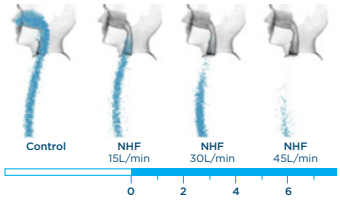
The mechanisms of action differ from those of conventional therapies, as do the resulting physiological effects and clinical outcomes.

Read more about mechanisms at:
fphcare.com/opti/mechanisms

Respiratory support

Reduction of dead space

The effects of flow rate on clearance of rebreathing CO_2



Adapted from Möller et al.[1]

Clearance of expired air in the upper airways[1]

Reduces rebreathing of gas with high CO_2 and depleted O_2[1]

Increases alveolar ventilation[1]

Dynamic positive airway pressure

The effects of NHF on airway pressure, end-expiratory lung volume and tidal volume

Adapted from Corley et al.[5]

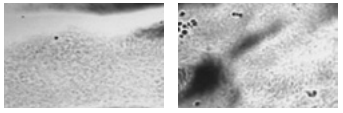
Breath- and flow-dependent airway pressure[3,4]

Promotes slow and deep breathing[3]

Increases alveolar ventilation[1,5]

Airway hydration

The effects of high flows of warm, humidified air on mucociliary transport



Adapted from Tatkov et al.[14]

Optimal Humidity

Prevents desiccation of the airway epithelium[6]

Improves mucus clearance[6,7]

Patient comfort

Optimal Humidity

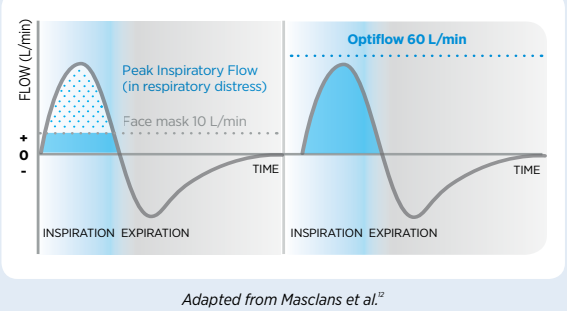
Open system No seal required

Comfortable[8,9] and easy to use

Patient tolerance[8,10]

Supplemental oxygen when required

Confidence in the delivery of blended, humidified oxygen[2,11], from 21% to 100%



Adapted from Masclans et al.[12]

PHYSIOLOGICAL EFFECTS & CLINICAL OUTCOMES

The mechanisms of respiratory support, airway hydration, patient comfort and supplemental oxygen contribute to distinct physiological effects...

- **IMPROVES** ventilation and gas exchange
  - **REDUCES** respiratory rate[5,8,11,13-16]
  - **REDUCES** carbon dioxide[1,3,17]
  - **INCREASES** tidal volume[5]
  - **INCREASES** end-expiratory lung volume[5]
- **IMPROVES** mucus clearance[7]
- **IMPROVES** oxygenation[2,5,8-10,12,13,16,18]

... and clinical outcomes:

Read clinical studies and other evidence at:
fphcare.com/opti/evidence-library

REDUCES escalation of care when used:

- as a first-line respiratory support[10]
- post-extubation[9,19-22]

REDUCES mortality rate[10]

IMPROVES symptomatic relief[8,10,11]

IMPROVES comfort and patient compliance[8,9,11,19,22]

Frat 2015

The New England Journal of Medicine

STUDY

A 23-center study[10] compared NHF to use of a non-rebreather mask (standard oxygen) and NIV as a primary treatment. The primary outcome was the number of patients intubated at day 28 (not attained).

METHOD

310 pre-intubation patients in acute hypoxemic respiratory failure (PaO_2:FiO_2 ≤ 300 mmHg) were randomized to receive NHF, non-rebreather mask or NIV.

RESULTS

- **NHF significantly reduced ICU** (p=0.047) **and 90-day mortality** (p=0.02)
- The primary outcome was not met for all patients (p=0.18), however, **NHF significantly reduced the need for intubation in more acute patients (PaO_2:FiO_2 ≤ 200 mmHg)** (p=0.009)
- Significant increase in ventilator-free days on NHF (p=0.02)
- NHF significantly reduced intensity of respiratory discomfort (p<0.01) and dyspnea (p<0.001)

MV = mechanical ventilation; SOT = standard oxygen treatment.

Hernández (Apr) 2016

Journal of the American Medical Association

STUDY

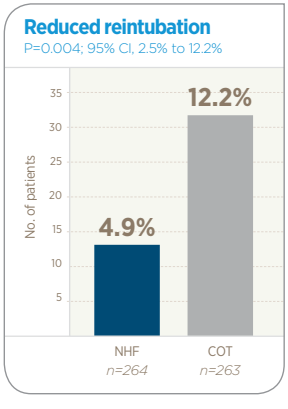
A 7-center study[20] compared the efficacy of NHF to use of conventional oxygen therapy (COT) post-extubation. The primary outcome was reintubation within 72 hours.

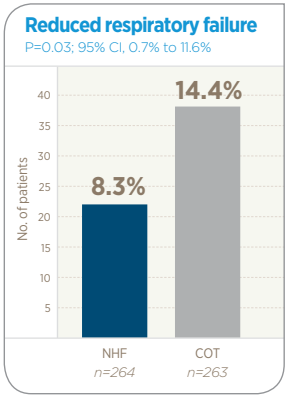
METHOD

527 patients at low risk of reintubation (age < 65; APACHE score < 12; BMI < 30 etc.) were randomized to receive NHF or COT (via nasal prongs or a non-rebreather).

RESULTS

- **NHF significantly reduced reintubation** (p=0.004) and post-extubation respiratory failure (p=0.03)
- Successfully extubated patients (in both groups) had a shorter duration of mechanical ventilation (p<0.001), ICU stay (p<0.001) and hospital stay (p=0.005)





Hernández (Oct) 2016

Journal of the American Medical Association

STUDY

A 3-center non-inferiority study[21] compared use of NHF to bi-level positive airway pressure (BPAP) post-extubation. The primary outcomes were reintubation and post-extubation respiratory failure within 72 hours.

METHOD

604 patients at high risk of reintubation (age > 65; APACHE score > 12; BMI > 30 etc.) were randomized to receive NHF or BPAP. The non-inferiority margin was 10%.

RESULTS

- NHF was non-inferior to BPAP for **preventing reintubation:** 22.8% (66/290) NHF group vs. 19.1% (60/314) BPAP group reintubated
- NHF was non-inferior to BPAP for **preventing post-extubation respiratory failure:** 26.9% (78/290) NHF group vs. 39.8% (125/314) BPAP group had post-extubation respiratory failure
- No patients in the NHF group suffered adverse effects requiring withdrawal of the therapy, compared to 42.9% of patients in the BPAP group (p<0.001)
- Median ICU length of stay was lower in the NHF group: 3 days (NHF) vs. 4 days (BPAP) (p=0.048)

USAGE

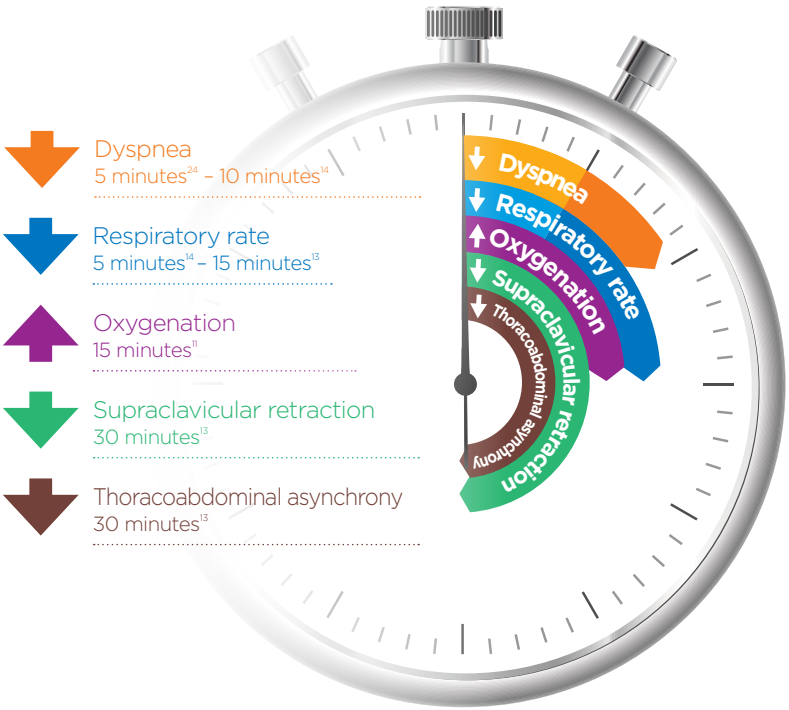
There is an ever-increasing body of clinical literature which may provide guidance on the day-to-day application of Optiflow NHF

When are the effects of Optiflow NHF seen?

Sztrymf[13] associated Optiflow NHF with sustained beneficial effects on oxygenation and physiological parameters for patients with acute respiratory failure.

Similarly Rittayamai[14] showed significant improvement in post-extubation patients.

These studies may provide guidance on patient responses to the therapy.



View more frequently asked usage questions at:
fphcare.com/opti/usage

Is there a way to predict the outcome of NHF?

The validated ROX index[25] predicts failure in adults with AHRF receiving NHF, at 4 time intervals: 2, 6, 12 and > 12 hours. It's an easy-to-use dynamic bedside tool.

$$\frac{SpO_2 / FiO_2}{\text{Respiratory Rate}} = \textbf{ROX index}$$

Example at 6 hours

SpO_2 = **88%**

FiO_2 = **.70**

RR = **28** breaths/minute

$$\frac{88 / .70}{28} = \mathbf{4.48}$$

In the example above, the resulting score of 4.48 is greater than the score for predicted failure at 6 hours (3.47 as shown in the ROX Score table right). Therefore, continued NHF treatment should be considered.

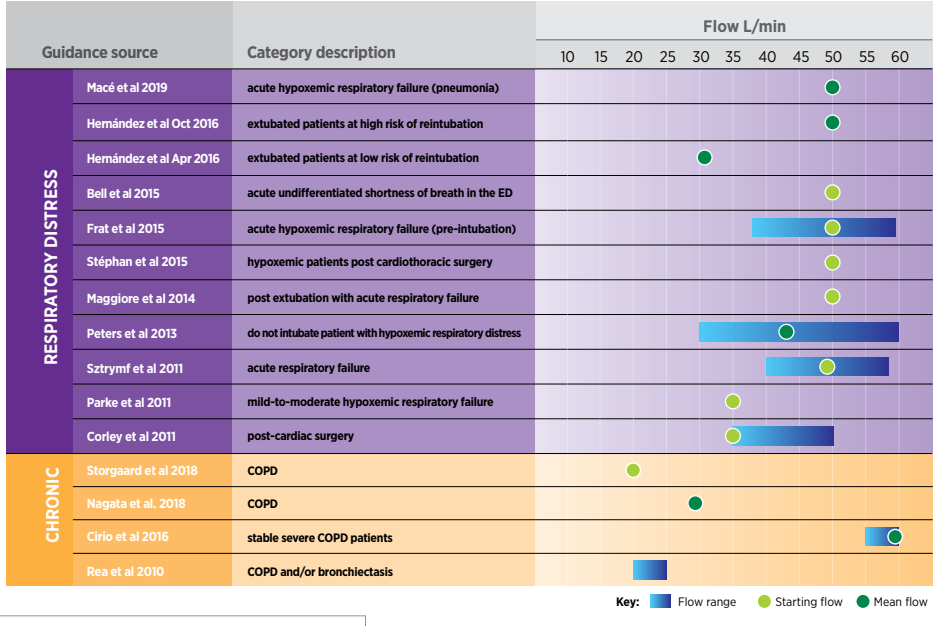
ROX score margin for failure over time

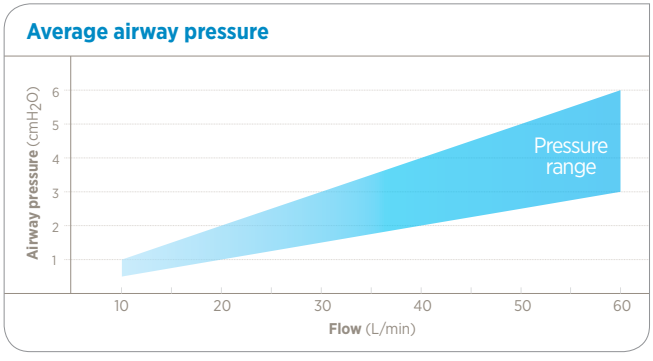
Time Point (Hours of NHF use)	**ROX Score**	**Positive Predictive Value %**
2 hours	< 2.85	98
6 hours	**< 3.47**	98–99
12 hours	< 3.85	99
> 12 hours	< 4.88	80

View more frequently asked usage questions at:
fphcare.com/opti/usage

What flow rates and ranges are used?

The adjacent table lists starting flows and flow ranges used in clinical studies.[5,9,10,13,16,19-22,25-31]





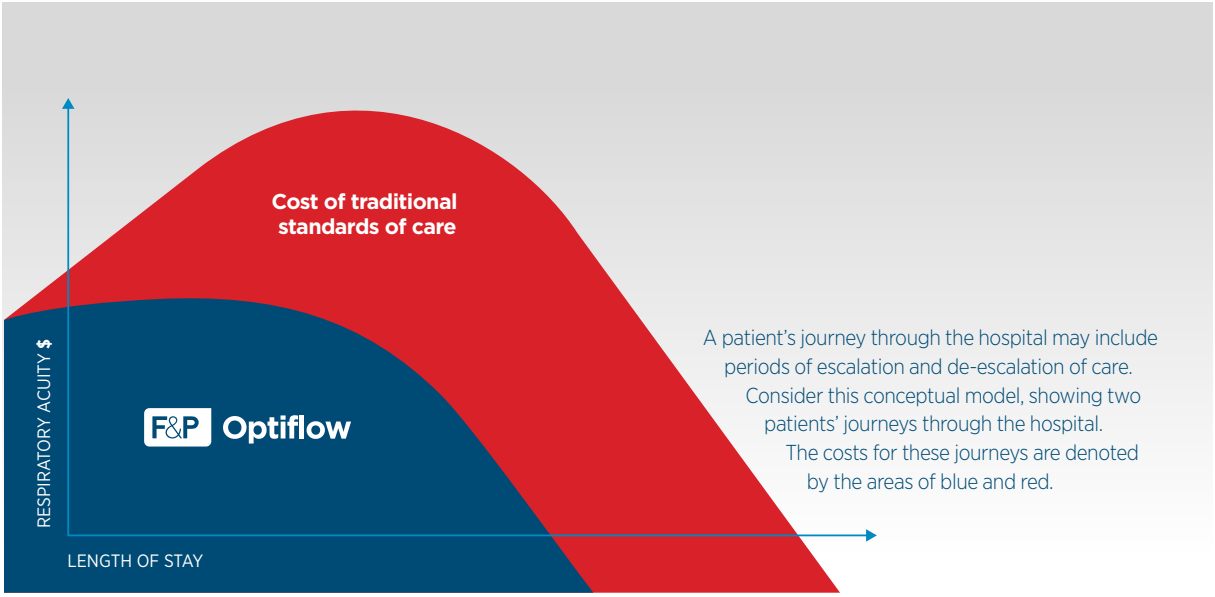
What is the approximate average dynamic pressure generated?

Average pressure increases approximately 0.5 - 1 cmH_2O per 10 L/min.[2,4,32]

Pressure ranges are cannula and patient dependent. For illustrative purposes only.

COST BENEFITS

Use Optiflow NHF to reduce escalation[10,20] thereby avoiding associated costs



Using Optiflow NHF as a first-line therapy (both pre-intubation and post-extubation) may reduce a patient's escalation 'up the acuity curve', resulting in better patient outcomes and reduced costs of care.

OPTIFLOW IN PRACTICE

Watch the Berkshire video at:
www.fphcare.com/us/hospital/adult-respiratory/optiflow/optiflow-in-practice/

Introducing **Optiflow to the Royal Berkshire Hospital**

This video shows the usage of AIRVO 2 & Optiflow Nasal High Flow therapy in different departments of the Royal Berkshire Hospital in Reading, UK. It shows the benefits they have found to both patients and hospital since its introduction.

Evaluate **F&P Optiflow**

Publications in the NEJM and JAMA suggest Optiflow NHF may improve patient outcomes[10] and reduce the need for higher level support[20,21] thereby avoiding the associated costs[33].

Fisher & Paykel Healthcare will provide training and equipment during an Optiflow NHF evaluation to help you achieve these goals in your hospital. Let us customize an evaluation to suit you.
