F&P Optiflow Nasal High Flow

Fisher & Paykel Healthcare
Understand Optiflow™ Nasal High Flow

Optiflow Nasal High Flow (NHF) delivers respiratory support to your spontaneously breathing patients, by providing heated, humidified air and oxygen at flow rates up to 60 L/min through the unique Optiflow nasal cannula.

Read on to discover more about:
- mechanisms
- physiological effects
- clinical outcomes and how using Optiflow NHF can reduce escalation, thereby avoiding its associated costs.

MECHANISMS OF ACTION

With Optiflow NHF, you can independently titrate flow and oxygen concentration (FiO₂ 21 - 100%) according to your patient’s needs.

The mechanisms of action differ from those of conventional therapies, as do the resulting physiological effects and clinical outcomes.

Read more about mechanisms at: fphcare.com/opti/mechanisms
Respiratory support

- Reduction of dead space
- Dynamic positive airway pressure

Airway hydration

- Optimal Humidity
- Prevents desiccation of the airway epithelium
- Improves mucus clearance

Patient comfort

- Optimal Humidity
- Open system
- No seal required
- Comfortable and easy to use
- Patient tolerance

Supplemental oxygen when required

- Confidence in the delivery of blended, humidified oxygen, from 21% to 100%

Optiflow 60 L/min

- Peak Inspiratory Flow (in respiratory distress)
- Face mask 10 L/min

Adapted from Ritchie et al.\(^2\)

Adapted from Masclans et al.\(^2\)
**PHYSIOLOGICAL EFFECTS & CLINICAL OUTCOMES**

The mechanisms of respiratory support, airway hydration, patient comfort and supplemental oxygen contribute to distinct physiological effects...

- **IMPROVES** ventilation and gas exchange
- **REDUCES** respiratory rate\(^5,8,11,13-16\)
- **REDUCES** carbon dioxide\(^1,3,17\)
- **INCREASES** tidal volume\(^5\)
- **INCREASES** end-expiratory lung volume\(^5\)
- **IMPROVES** mucus clearance\(^7\)
- **IMPROVES** oxygenation\(^2,5,8-10,12,13,16,18\)
... and clinical outcomes:

↓ **REDUCES** escalation of care when used:

- as a first-line respiratory support\(^\text{10}\)
- post-extubation\(^\text{9,19-22}\)

↓ **REDUCES** mortality rate\(^\text{10}\)

↑ **IMPROVES** symptomatic relief\(^\text{8,10,11}\)

↑ **IMPROVES** comfort and patient compliance\(^\text{8,9,11,19,22}\)

**Frat 2015**

*The New England Journal of Medicine*

**STUDY**

A 23-center study compared NHF to use of a non-rebreather mask (standard oxygen) and NIV as a primary treatment. The primary outcome was the number of patients intubated at day 28 (not attained).

**METHOD**

310 pre-intubation patients in acute hypoxemic respiratory failure (\(\text{PaO}_2:\text{FiO}_2 \leq 300\) mmHg) were randomized to receive NHF, non-rebreather mask or NIV.

**RESULTS**

- **NHF significantly reduced ICU** (\(p=0.047\)) and **90-day mortality** (\(p=0.02\))
- **The primary outcome was not met for all patients** (\(p=0.18\)), however, **NHF significantly reduced the need for intubation in more acute patients** (\(\text{PaO}_2:\text{FiO}_2 \leq 200\) mmHg) (\(p=0.009\))
- **Significant increase in ventilator-free days on NHF** (\(p=0.02\))
- **NHF significantly reduced intensity of respiratory discomfort** (\(p<0.01\)) and dyspnea (\(p<0.001\))

**Acute hypoxaemic respiratory failure***

Criteria for immediate or imminent intubation are present.

**NO**

**Intubation and invasive MV**

NHF for improving pre-oxygenation and peri-laryngoscopy oxygenation

- **FiO\(_2\) 100%**
- **Flow rate 60 L·min\(^{-1}\)**

**Within 1-2 h**

**Titration**

- **FiO\(_2\) based on target **\(\text{SpO}_2 \geq 88-90\)%**
- **Flow rate based on < 25-30 breaths·min\(^{-1}\)** and patient comfort
- **Temperature based on patient comfort.**

**Monitoring**

Presence of prognostic factors within hours [maximum 48 h]

**YES**

**NO**

**Noninvasive MV**

Short trial [1-2 h]

**Reduced intubation rate (%)***

\(p=0.009\); patients with \(\text{PaO}_2:\text{FiO}_2 \leq 200\) mmHg

- Nasal High Flow: 35%
- Standard oxygen: 53%
- Noninvasive ventilation: 58%

**Reduced ICU mortality (%)**

\(p=0.047\)

- Nasal High Flow: 11%
- Standard oxygen: 19%
- Noninvasive ventilation: 25%

Hernández (Apr) 2016

Journal of the American Medical Association

STUDY

A 7-center study\textsuperscript{20} compared the efficacy of NHF to use of conventional oxygen therapy (COT) post-extubation. The primary outcome was reintubation within 72 hours.

METHOD

527 patients at low risk of reintubation (age < 65; APACHE score < 12; BMI < 30 etc.) were randomized to receive NHF or COT (via nasal prongs or a non-rebreather).

RESULTS

\begin{itemize}
\item NHF significantly reduced reintubation (p=0.004) and post-extubation respiratory failure (p=0.03)
\end{itemize}

\begin{itemize}
\item Successfully extubated patients (in both groups) had a shorter duration of mechanical ventilation (p<0.001), ICU stay (p<0.001) and hospital stay (p=0.005)
\end{itemize}

Hernández (Oct) 2016

Journal of the American Medical Association

STUDY

A 3-center non-inferiority study\textsuperscript{21} compared use of NHF to bi-level positive airway pressure (BPAP) post-extubation. The primary outcomes were reintubation and post-extubation respiratory failure within 72 hours.

METHOD

604 patients at high risk of reintubation (age > 65; APACHE score > 12; BMI > 30 etc.) were randomized to receive NHF or BPAP. The non-inferiority margin was 10%.

RESULTS

\begin{itemize}
\item NHF was non-inferior to BPAP for preventing reintubation: 22.8% (66/290) NHF group vs. 19.1% (60/314) BPAP group reintubated
\item NHF was non-inferior to BPAP for preventing post-extubation respiratory failure: 26.9% (78/290) NHF group vs. 39.8% (125/314) BPAP group had post-extubation respiratory failure
\item No patients in the NHF group suffered adverse effects requiring withdrawal of the therapy, compared to 42.9% of patients in the BPAP group (p<0.001)
\item Median ICU length of stay was lower in the NHF group: 3 days (NHF) vs. 4 days (BPAP) (p=0.048)
\end{itemize}
When are the effects of Optiflow NHF seen?

Sztrymf\textsuperscript{13} associated Optiflow NHF with sustained beneficial effects on oxygenation and physiological parameters for patients with acute respiratory failure. Similarly Rittayamai\textsuperscript{14} showed significant improvement in post-extubation patients. These studies may provide guidance on patient responses to the therapy.

**Usage**

There is an ever-increasing body of clinical literature which may provide guidance on the day-to-day application of Optiflow NHF.
What flow rates and ranges are used?

The adjacent table lists starting flows and flow ranges used in clinical studies.

Average pressure increases approximately 0.5 - 1 cmH₂O per 10 L/min.²,4,10

Pressure ranges are cannula and patient dependent. For illustrative purposes only.
COST BENEFITS
Use Optiflow NHF to reduce escalation\textsuperscript{10,20} thereby avoiding associated costs.

A patient’s journey through the hospital may include periods of escalation and de-escalation of care. Consider this conceptual model, showing two patients’ journeys through the hospital. The costs for these journeys are denoted by the areas of blue and red.

Using Optiflow NHF as a first-line therapy (both pre-intubation and post-extubation) may reduce a patient’s escalation ‘up the acuity curve’, resulting in better patient outcomes and reduced costs of care.

We call this F&P Optiflow FIRST.
Evaluate F&P Optiflow FIRST

Publications in the NEJM and JAMA suggest Optiflow NHF may improve patient outcomes\textsuperscript{10} and reduce the need for higher level support\textsuperscript{20,21} thereby avoiding the associated costs\textsuperscript{31}.

Fisher & Paykel Healthcare will provide training and equipment during an Optiflow NHF evaluation to help you achieve these goals in your hospital. Let us customize an evaluation to suit you. Visit fphcare.com/opti/eval
