HC550 HEATED HUMIDIFIER

The HC550 heated humidifier is part of the F&P 550 System designed to deliver optimally humidified gas to patients in the home or in long-term care facilities.

This dual-feedback system incorporates advanced algorithms designed to achieve optimal levels of humidity, while minimizing caregiver attention.

The simplified system interface of the HC550 displays only the required information for easy operation in the home or in long-term care facilities.
F&P 550™ System

Maintaining the natural balance

The F&P 550 System, from the developers of ThermoSmart™ technology, is designed to deliver Optimal Humidity while reducing condensate.

**PHYSIOLOGICAL HUMIDITY**

The goal of airway humidification is to maintain and support the normal physiological environment in the airways. Healthy individuals breathing in ambient air, e.g. 22 °C, 7 mg/L, warm and humidify the air to an average of 31 °C, 32 mg/L with nasal breathing at the pharynx.

Bypassing the natural humidification systems in the upper airway, for example with a tracheostomy, means that a patient’s airways become less efficient at warming and humidifying gas. Bypassed airways result in impaired sneeze and gag reflexes, meaning that the principal remaining line of airway defense is the mucociliary transport system.

The F&P 550 System is designed to deliver Optimal Humidity of 37 °C, 44 mg/L (100% Relative Humidity) to patients with bypassed airways. This preserves mucociliary function and maintains mucus clearance.

**GOALS OF OPTIMAL HUMIDITY**

- Preserve mucociliary function
- Reduce airway drying
- Clear retained secretions
- Maintain patient airways
- Allow ease of suctioning
- Maximize patient outcomes

The F&P 550 System has been designed to deliver Optimal Humidity (37 °C, 44 mg/L) in the home or long-term care facilities.

The HC550 humidifier has fewer user-adjustable settings and technical displays than those on hospital-focused humidifiers. Designed with only two user-operated buttons, a power button and a mute button, sophisticated measurement technologies and control algorithms manage temperature control in a range of ambient environments, while smart sensing technologies detect periods of standby, reducing nuisance alarms.

### Accessories
- A heater-wire adaptor provides power to heated circuits and the temperature/flow probe provides feedback from chamber and circuit

### Setup indicator diagram and alarms
- Setup issues or alarm states are indicated by lighted areas on a simplified diagram and audio alarms

### Preset temperature output
- Set by the clinician, minimizing user setup
- Mode of operation can be set using an advanced menu

### Color-coded sockets
- Color coded for easy operation
- Secure connection
- Connection errors are detected

### DirectConnect invasive interfaces
- Delivers optimally humidified gas directly into a tracheostomy, allowing ease of positioning and freedom of movement

### Dual spiral heater-wire condensation management
- Ensures even heat distribution leading to reduced condensate
- Lightweight, highly flexible tubing

### Predual-float auto-feed chamber
- Automatic refilling from a water bag and a dual-float mechanism, to maintain a consistent water level

### Subdued display and indicators
- Visible only when required – during setup or alarm states
